
概率与数理统计试题 A 卷

一、(12 分)

解：设 A_1 表示“取到第一台车床加工的零件”

设 A_2 表示“取到第二台车床加工的零件”

设 B 表示“任取一个零件是不合格品”

$$\text{且} \quad P(A_1) = \frac{2}{3} \quad P(A_2) = \frac{1}{3}$$

$$P(B|A_1)=0.03, \quad P(B|A_2)=0.06.$$

因此

$$P(B) = \sum_{i=1}^2 P(A_i)P(B|A_i) = \frac{2}{3} \times 0.03 + \frac{1}{3} \times 0.06 = 0.04$$

(2)

$$P(A_2 | B) = \frac{P(A_2 B)}{P(B)} = 0.5$$

二、(12 分)

解：(1) 由分布律的性质得

$$a + \frac{1}{2} + \frac{1}{4} = 1$$

又由

$$P\left(X \leq \frac{1}{2}\right) = \frac{1}{4},$$

解得

$$a = \frac{1}{4}, \quad b = \frac{1}{2}$$

(2) X 的分布函数

$$F(x) = \begin{cases} 0, & x < -1 \\ \frac{1}{4}, & -1 \leq x < -\frac{1}{2} \\ \frac{3}{4}, & -\frac{1}{2} \leq x < \frac{3}{2} \\ 1, & x \geq \frac{3}{2} \end{cases}$$

(3)

$$P\left(\frac{3}{2} < X \leq \frac{5}{2}\right) = \frac{1}{2}, \quad P(2 \leq X \leq 3) = \frac{3}{4}$$

三、(16 分)

1、解:

$$(1) \quad f_X(x) = \int_{-\infty}^{\infty} f(x, y) dy = \begin{cases} \int_x^{+\infty} e^{-y} dy = e^{-x}, & x > 0, \\ 0, & \text{其他.} \end{cases}$$

$$f_Y(y) = \int_{-\infty}^{\infty} f(x, y) dx = \begin{cases} \int_0^y e^{-y} dx = ye^{-y}, & y > 0, \\ 0, & \text{其他.} \end{cases}$$

$$(2) \quad P(X > 1) = \int_1^{+\infty} e^{-x} dx = e^{-1}.$$

$$(3) \quad f_Z(z) = \int_{-\infty}^{\infty} f(x, z-x) dx.$$

被积函数的非零域:

$$0 < x < z - x.$$

$$f_Z(z) = \begin{cases} \int_0^{\frac{z}{2}} e^{-(z-x)} dx = e^{-\frac{z}{2}} - e^{-z}, & z > 0, \\ 0, & \text{其他.} \end{cases}$$

2、解：三角形的基本性质：

任意两边之和大于第三边.

以 $[0,1]$ 区间代表木棍, $X_1 < X_2$

代表两个截点,

U 代表构成三角形这一事件,

则三边边长为 $X_1, X_2 - X_1, 1 - X_2$

要满足下列不等式

$$X_2 \geq 1 - X_2 \Rightarrow X_2 \geq 0.5$$

$$1 - X_1 \geq X_1 \Rightarrow X_1 \leq 0.5$$

$$1 - X_2 + X_1 \geq X_2 - X_1 \Rightarrow X_2 - X_1 \leq 0.5$$

则

$$P(U) = \frac{\frac{1}{2} \times \left(\frac{1}{2}\right)^2}{\frac{1}{2} \times 1^2} = \frac{1}{4}.$$

四、(16 分)

解：(1)

$$EX = \iint_{R^2} xf(x, y)dx dy = \int_0^1 dx \int_0^x x \cdot 3xdy = \int_0^1 3x^3 dx = \frac{3}{4}$$

$$EY = \iint_{R^2} yf(x, y)dx dy = \int_0^1 dx \int_0^x y \cdot 3xdy = \int_0^1 \frac{3}{2} x^3 dx = \frac{3}{8}$$

$$EXY = \iint_{R^2} xyf(x, y)dx dy = \int_0^1 dx \int_0^x xy \cdot 3xdy = \int_0^1 \frac{3}{2} x^4 dx = \frac{3}{10}$$

$$EX^2 = \iint_{R^2} x^2 f(x, y)dx dy = \int_0^1 dx \int_0^x x^2 3xdy = \int_0^1 3x^4 dx = \frac{3}{5}$$

$$EY^2 = \iint_{R^2} y^2 f(x, y)dx dy = \int_0^1 dx \int_0^x y^2 \cdot 3x \cdot dy = \int_0^1 x^4 dx = \frac{1}{5}$$

$$DX = EX^2 - (EX)^2 = \frac{3}{80},$$

$$DY = EY^2 - (EY)^2 = \frac{19}{320}$$

$$\text{Cov}(X, Y) = EXY - EXEY = \frac{3}{160}$$

$$\rho_{XY} = \frac{\text{Cov}(X, Y)}{\sqrt{DX \cdot DY}} = \sqrt{\frac{3}{19}}$$

(2)

$$p = P(X + Y \leq 1) = \iint_{x+y \leq 1} f(x, y) dx dy = \int_0^{1/2} dy \int_y^{1-y} 3x dx = \int_0^{1/2} \frac{3}{2} (1-2y) dy = \frac{3}{8}$$

则 $Z \sim B(4, 3/8)$. 故 $E(Z) = 3/2$;

$$P(Z \geq 1) = 1 - P(Z = 0) = 1 - \left(1 - \frac{3}{8}\right)^4 = \frac{3471}{4096}.$$

五、(8 分)

解：设 X_i 为第 i 个零件的重量，
 $i=1, 2, \dots, n, n=36$.

由题意，

$$E(X_i) = \mu = 50, D(X_i) = \sigma^2 = 5^2, n = 36, i = 1, 2, \dots, n.$$

由中心极限定理，

$$\frac{\sum_{i=1}^n X_i - n\mu}{\sqrt{n}\sigma} \text{ 近似服从标准正态分布.}$$

$$\begin{aligned} P\left(\sum_{i=1}^n X_i \leq 1740\right) &= P\left(\frac{\sum_{i=1}^n X_i - n\mu}{\sqrt{n}\sigma} \leq \frac{1740 - n\mu}{\sqrt{n}\sigma}\right) \approx \Phi\left(\frac{1740 - 36 \times 50}{\sqrt{36} \times 5}\right) \\ &= 1 - \Phi(2) = 1 - 0.9772 = 0.0228. \end{aligned}$$

六、(8 分)

解：因为 $X_1, X_2, \dots, X_9$ 相互独立，
且服从正态分布，所以

$$Y \sim N\left(\mu, \frac{\sigma^2}{6}\right), \quad Z \sim N\left(\mu, \frac{\sigma^2}{3}\right)$$

而 Y 与 Z 相互独立，

故 $Y - Z \sim N\left(0, \frac{\sigma^2}{2}\right)$

因此 $\frac{Y - Z}{\frac{\sigma}{\sqrt{2}}} \sim N(0, 1)$

又 $\frac{2S^2}{\sigma^2} \sim \chi^2(2),$

且二者相互独立，故

$$\begin{aligned} & \frac{\frac{Y - Z}{\frac{\sigma}{\sqrt{2}}}}{\sqrt{\frac{2S^2}{2\sigma^2}}} \\ &= \frac{\sqrt{2}(Y - Z)}{S} \sim t(2) \end{aligned}$$

即 $W = \frac{\sqrt{2}(Y - Z)}{S} \sim t(2)$

七、(16 分) .

解：1、(1)由于 $EX = 0 \times p^2 + 1 \times (1 - p^2) = 1 - p^2$

令 $EX = \bar{X}$

即 $1 - p^2 = \bar{X}$

解得 p 的矩估计为 $\hat{p} = \sqrt{1 - \bar{X}}$

由于 $\bar{x} = \frac{1}{4}(x_1 + x_2 + x_3 + x_4) = \frac{3}{4}$,

因此 p 的矩估计值为 $\hat{p} = \frac{1}{2}$

2、 X 的概率密度函数为

$$f(x) = \frac{1}{\sqrt{2\pi}} \exp \left\{ -\frac{1}{2}(x - \mu)^2 \right\}$$

似然函数为

$$L(\mu) = \prod_{i=1}^n \frac{1}{\sqrt{2\pi}} \exp \left\{ -\frac{1}{2}(x_i - \mu)^2 \right\} = \frac{1}{(\sqrt{2\pi})^n} \exp \left\{ -\frac{1}{2} \sum_{i=1}^n (x_i - \mu)^2 \right\}$$

对数似然函数为

$$\ln L(\mu) = -n \ln(\sqrt{2\pi}) - \frac{1}{2} \sum_{i=1}^n (x_i - \mu)^2$$

对 μ 求导并令其为零,

$$\text{即得 } \frac{d \ln L}{d \mu} = \sum_{i=1}^n x_i - n\mu = 0$$

解得 μ 的最大似然估计为

$$\hat{\mu} = \frac{1}{n} \sum_{i=1}^n X_i = \bar{X}$$

$$\text{由于 } E\hat{\mu} = E\left(\frac{1}{n} \sum_{i=1}^n X_i\right) = EX = \mu,$$

因此 $\hat{\mu}$ 是 μ 的无偏估计.

八、(12 分)

解：(1) 假设

$$H_0: \mu = 70; \quad H_1: \mu \neq 70$$

选取检验统计量 $\frac{\bar{X} - 70}{15/\sqrt{36}}$

构造拒绝域： $\left| \frac{\bar{x} - 70}{15/\sqrt{36}} \right| \geq z_{\alpha/2}$

$n=36, \alpha=0.05,$

查表得 $z_{\alpha/2} = z_{0.025} = 1.96$

计算得： $\left| \frac{\bar{x} - 70}{15/\sqrt{36}} \right| = \left| \frac{66.5 - 70}{15/\sqrt{36}} \right| = 1.4 < 1.96$

故不拒绝 H_0 ，可以认为这批产品的平均质量为 70 公斤。

(2) 犯第一类错误的概率为

$$P\left(\left| \frac{\bar{X} - 70}{15/\sqrt{36}} \right| > z_{0.025} \mid \mu = 70\right) = 0.05$$
